

Amendments to the Specification

Please amend the third paragraph of Page 20, as follows:

Preferably, the assembly 504 is disposed at an angle of ~~between about 30 degrees to about 60~~ approximately 10-45 degrees, more preferably at ~~about 45~~ approximately 15-30 degrees, from the horizontal. In addition, a vacuum source may be connected to the tubes 508 for example at line 542 for example at in order to maintain a vacuum, preferably a deep vacuum within the tubes 508, for example a vacuum measuring between about 10 to 100 Torr. The deep vacuum allows more rapid desorption at a lower heat requirement.
